import java.util.Scanner;

public class Complex {
    int real, image;
    public Complex(){
        Scanner s= new Scanner(System.in);
        System.out.println("Enter real number of complex number");
        real=s.nextInt();

        System.out.println("Enter image of complex number");
        image=s.nextInt();
        System.out.println(real+"+i"+image);
    }

    /**
     * @param args the command line arguments
     */
    public static void main(String[] args) {
        Complex s1=new Complex();
        Complex s2=new Complex();
        int r=s1.real+s2.real;
        int i=s1.image+s2.image;
        System.out.println("Sum of complex number is:");
        System.out.println(r+"+i"+i);

        // TODO code application logic here
